Sum of Churn_Probability, Sum of Average_Order_Value and Sum of Purchase_Frequency by Customer_ID

The chart displays three metrics over a series of customer IDs (labeled as CU...). The Y-axis represents the 'Sum of C...' (likely Churn_Probability, Average_Order_Value, or Purchase_Frequency) ranging from 0 to 200. The X-axis shows individual customer IDs. The legend indicates three series: Sum of Churn_Probability (blue), Sum of Average_Order_Value (dark blue), and Sum of Purchase_Frequency (orange). The orange line (Purchase Frequency) generally stays above the other two, fluctuating between approximately 100 and 200. The dark blue line (Average Order Value) follows a similar pattern but at lower values, mostly between 50 and 150. The blue line (Churn Probability) remains consistently low, near zero.
